

I just deployed 100 Apache web servers on 10 machines in 3 countries.

(My boss thinks it will take 4 more days.)

Suddenly you're the hero. You've unified your Web infrastructure on the trusted technology that powers over 50 percent of the most trafficked* sites in the world – Apache. With Apache's superior security track record, no more sleepless nights worrying about the latest worm and the midnight call from the CIO. And you've picked the solution that makes Apache more secure, more reliable, and easier to manage: Covalent Enterprise Ready Server (ERS).

Covalent ERS combines the power of open source Apache with the robust features demanded by the enterprise. For the first time, you can easily manage distributed Apache Web servers from one central management portal. So do yourself a favor and let Covalent Enterprise Ready Server alert you if something goes wrong. In the meantime, what are you going to do with those 4 days?
